Use case UC1: Appointment Booking
Primary Actor: Administrative Staff
Stakeholder and Interests:

Patient:
- Wants to obtain an appointment with a healthcare professional.
- Wants an available appointment time and date that meets their needs

Administrative Staff:
- Wants to book appointments efficiently with no scheduling errors

Healthcare Professional:
- Wants appointments to respect their schedule
- Wants accurate information about their appointments.

Clinic:
- Wants appointments to be organized and recorded
- Wants to ensure scheduling constraints are respected

Preconditions:

-Administrative Staff is authenticated and authorized to manage all appointments

-Patient has an existing record inside the system

-Patient has already arrived at the clinic location to request said appointment.

Success Guarantee (Postconditions):

-Appointment has been recorded successfully inside the system

-The appointment is associated with both the correct patient and the correct healthcare professional

-Appointment has to respect the healthcare professional's schedule

Main success scenario:

1. Patient requests an appointment form the Administrative Staff

2. The Administrative Staff searches for the patient's clinical record using their information

3. System displays the matching patient's clinical record

4. The Administrative Staff selects the patient and the medical service they have requested

5. The System then checks the healthcare professional's availability (through the schedule) and displays the available appointments slots.

6. The Administrative Staff selects the available time, date and healthcare professional for the consultation

7. System confirms the appointment details

8. If necessary, the Administrative Staff will provide the required referral information, and the System verifies the referral (to make sure it is real)

9. Administrative Staff confirms appointment

10. System will then save the appointment, and a confirmation will be displayed

Failure scenario:

5a. No appointment slots are available for the requested medical service (date or time). The System notifies the Administrative Staff of the information and confirms that no Appointment is booked.

Special Requirements:

-Appointment information must be displayed in the terminal

-The System has to respect the healthcare professional's schedule

-There must be a hierarchy put in place for who can see what in regards to the patient's information.

Technology and Data Variations List:

-The information on both the patient and the appointment are entered inside the command line

-Patients can be searched using their insurance number, date of birth, phone number and/or names (First and Last)

Open Issues:

-What happens if a required medical referral is missing/invalid?
